# Pattern: Audit logging

pattern (/tags/pattern) observability (/tags/observability) service design (/tags/service design)

## Context

You have applied the Microservice architecture pattern (../microservices.html).

## Problem

How to understand the behavior of users and the application and troubleshoot problems?

## Forces

- It is useful to know what actions a user has recently performed: customer support, compliance, security, etc.

## Solution

Record user activity in a database.

## Examples

This pattern is widely used.

## Resulting Context

This pattern has the following benefits:

- Provides a record of user actions

This pattern has the following drawbacks:

- The auditing code is intertwined with the business logic, which makes the business logic more complicated

## Related patterns

- Event Sourcing (../data/event-sourcing.html) is a reliable way to implement auditing

pattern (/tags/pattern) observability (/tags/observability) service design (/tags/service design)

I,m sorry i want to ask,
Does this audit logging use microservice?
Thankyou atention

I have implemented this pattern using a dedicated microservice to log the audit logs. However, I am wondering about the best practice to audit log, should it be triggered by client app (which is followed by many services where FE calls audit log API ) or to be triggered by the BE service, but with the latter I have some issues like in FE many times it calls too many services to load the screen, let say we have a ticket, the ticket has audit log records, ticket details, ticket documents, emails, actions...etc....each loaded from a separate ms...so we need to log that the user x viewed ticket y ....
Should we follow the first or the second approach?
